It's only a security risk if it's doing so without your knowledge, consent, or control. IIUC, this is a user-configurable option, so you have control.

AFAICS this is without your control.

And if you use OpenDNS because you **want** this type of protection, then it's with your consent.

It is within your consent if they add sites on their censorship list which are not related to phishing at all, and this without your knowledge?

Your comment is like claiming that a firewall is a security risk because it causes Denial of Service when it prevents you from accessing certain sites or using some applications.

It is. A firewall shouldn't do such a thing.
