Hi,

I'm trying to setup a FreeBSD box with SSH to administer it (from a Windows computer with Putty). The connection work well with password authentication and SSH2 (I plan to used PubKey). What I would like to have is a Banner before the login prompt. I read in the manuel that I can do that with the "Banner" in the config file. That's not working.

I try:

"Banner /etc/ssh/warning" or

"Banner ./warning" or

"Banner warning"

I read something about "/etc/issue" and "/etc/issue.net" but it no longer apply to FreeBSD (no entry in the manual).

Can someone help me

Here is the info about My configuration:

On the server side:

OpenSSH_2.9 FreeBSD localisations 20011202, SSH protocols 1.5/2.0

When I connect, on the client side:

Server version: SSH-2.0-OpenSSH_2.9 FreeBSD localisations 20011202

We claim version: SSH-2.0-PuTTY

Using SSH protocol version 2

Host key fingerprint is:

1024 5a:64:49:54:4e:bb:ea:80:61:43:93:eb:91:3d:6d:04

Initialised triple-DES client->server encryption

Initialised triple-DES server->client encryption

Opened channel for session

Allocated pty

Started a shell/command

Thanks
