Hi – has anyone be able to port forward SMB –  
or SAMBA – using either Putty or the ssh.com Windows  
XP client and a SSH2 server running under Solaris?

I can login into the SSH2 server on a Solaris machine  
with both SSH clients.

I can port forward any port between any two  
Solaris or Linux machines.

I'm using port 139 on both sides, i.e., I'm forwarding  
the remote port 139 on the SSH2 server to localhost on the  
Windows XP machine then trying to access the filesystem by  
mapping

\\127.0.0.1\ken --> E: drive

with Windows Explorer.

But it complains that there is no path the volume.

Any help would be greatly appreciated.
