I purchased SSH Secure Shell for Windows Servers from SSH.com.

Installed the SSH on Windows2000. Set up all the security, can connect manually fine.

I have a Unix bax that I am trying to automatically connect to the Windows box and get log files. However, the batch file always prompts on connect at the password.

How do I get around this?

How do I make the Windows machine to be non-interactive login?

How do I get the Unix script login with the batchfile?

How do I setup the authentication for batch processes?

This is the only client that will be connecting to this machine so if I lock out manual connections, so be it, it all automated, and allows one connection at a time anyway.

SSH.com help is vague at best when you follow the instructions.

Any and all help is much appreciated...
