We've had trouble editing with putty. Without tinkering at all it supports keypad editing, for those of us with EDT fingers, and that was nice. I can log into VMS from a PC and edit with EDT just like a DECTERM window. However, whenever I paste into putty, from one putty screen to another, I get just enough errors to drive me crazy. A semicolon will be missing, or part of a word. So if I paste a 30-line function, when I compile I'll get about ten compilation errors. That's not true with TeraTerm, which seems to work just fine. If it only supported SSH2...

regards, Bill Manwaring, IUCF
