Hi--

I'm trying to ssh from a windows computer to a linux computer with a command-line command like this:

```
ssh -l "user-name" "linux-machine-ip" "command"
```

where "command" = a single command that I would like to run on the linux machine and then ssh is to exit. However, the command I would like to run requires itself to run in a terminal (I have set this command up so that it does what I want it to and exits w/o prompt or user intervention). The form of the ssh call above works for simple things like "cp", "mv", etc., but is there any way to trick these commands into believing that they are being called from a terminal? I don't really know how ssh does this, but if anyone can help me, that would be great.

Thanks,

R
