Hello,

We have successfully compiled and run OpenSSH vers 3.3->3.6 with PAM and TACACS+ with no problems. We are using Monta Vista 2.1 (kernel 2.4) on a custom PowerPC platform.

We have tried 3.7.1p1 it runs fine except that when using TACACS+, the password prompt keeps coming back over and over on our client machines. We put a sniffer and see the TACACS+ server being called so i know that the PAM modules are contacting the TACACS+ server.

We are using the sam sshd_config for all these versions, i have put in the UsePAM just for the heck of it, but once again the TACACS server is being called.

I know that a bunch of work has been done on the PAM modules with this new version.

Thanks for any help.
