Hello.

I have compiled openssh 3.7.1p2 on Aix 4.3.3 with gcc 3.2.1.

All works fine and chroot environment(users only can connect with sftp in their jail home) seems to be work fine, but from sftp client if i make a file transfer or i create a new folder inside user home it become crazy.

EG:

- 1.- User home /home/user (chroot environment and from sftp client this folder is /)
- 2.- I'm inside /home/user/htdocs (for user is /htdocs/)
- 3.- If i make a folder called "folder", it create /home/user/htdocsfolder, instead /home/user/htdocs/folder
- 4.- The same occur if it is a file name.

My sftp client is the last filezilla on windows machine.

Regards.
