Hello all. Hoping someone here might be able to help me before I approach the PuTTY folks.

I'm using latest version of PuTTY to connect from PC to a UNIX machine (term = xterm).

When I execute 'pg' on a file that contains a CONTROL L, the screen is being redrawn when this character is encountered, and nothing before the CONTROL L is displayed.

I do not have this problem with SSH Secure Shell.

Any ideas why this might be happening? bug? suggestions?

Much appreciated.

-Jeff
