I have a need to run both f secure ssh and open ssh on the same host. I also need to be able to point an incoming scp request to the proper scp binary on the server with both versions.

I have compiled openssh with the default path option, and it is still going to /usr/bin, even though my default path says to go where the binary actually is.

Both server and client are AIX machines. It appears the path is being generated by /etc/environment.

I have the two versions running on different ports and all else is working ok it seems.
