We're looking at using ftp utilising the ssh2 security between an ftp server and client.

is it possible to have additional functionality such as automated restart when the connection between the two is lost?

I know we could use other protocols for this, however at present there's a requirement that the client's could be any of the common ftp client programs hence looking at keeping it sftp.

apologies for the vagueness, however it's all I know at the moment...
