well, i'd say that for three hours of coding the result is not too bad. now plaunch can show the list of putty/puttytel windows and do some actions upon them: switch to window, hide/show and close it. i guess it would do as a temporary solution while Simon implements -N option. if you want, you can try out plaunch:
<http://dwalin.ru/putty/plaunch.exe>. be aware that it's a deep beta version in active development, so there is no documentation, not all features work and i'm not sure about compatibility with windows versions other than 2k and xp. :) truth to say, i'd like to have someone else than me to beta-test it. :)

p.s. almost forgot to say that there are keyboard shortcuts for some actions: win-p will bring up launch dialog, win-w will show the putty sessions list, and in this list the delete key works to kill. :) sorry, for now shortcuts are hardcoded, somewhen i'll make them configurable.

always at your service,
dwalin.
