

Does sftp-server support debug mode?

Hello,

does sftp-server inherit the debug mode from sshd? The debug mode of sshd works great but when I call subsystem sftp there are no more debug messages.

```
<log>
subsystem request for sftp
debug1: subsystem: exec() /usr/lib/sftp-server
debug1: PAM establishing creds
debug1: fd 10 setting O_NONBLOCK
debug2: fd 10 is O_NONBLOCK
</log>
```

That is all.
When the sftp-server quits I only see

```
<log>
debug1: Received SIGCHLD.
</log>
```

I dont see any reason why he dies (in case of a client or protocol error)

Thank you for your efforts!
