I SSH into an AIX 5.3 machine using a PuTTY 0.59 client and it pauses during the login. I login in another window, break out of the paused login and a ps shows the other one is paused in xauth. The command running is
xauth -q -
which when I run it on the command-line results in an interactive prompt in xauth. I assume this is the X11 forwarding that is doing this. How do I fix it? (I would like to keep the X11 forwarding.)

ssh -v
OpenSSH_4.3p2-hpn, OpenSSL 0.9.7i 28 Sep 2006

JohnK

Might this system be missing a few later patches? The only time I encountered something like this, the AIX box needed a "Critical Fix". Ask the server SysAdmin to check his patch level.
