Hello:

Is there an event that fires in the global.asax when a user is authenticated? And how do I determine if they already have the authentication ticket?

Here's my problem: I have some session state that I need to initialize upon login; using forms authentication and a dB. I also give them the option of keeping the authentication cookie alive between sessions. So, I would like to catch the authentication event, determine the state of my session, and if need be re-query for the session data from my dB.

Ex.

Normal Login – use username and password to retrieve CustID and other data from dB; save to session

Existing Auth. Ticket – retrieve CustID from cookie, query dB for other data and save to session

Thanks
