I assume that the former is the name of the user context that the page is running under (which, I believe, can be set programmatically), whereas the latter is the value that has been sent by the browser to the server as part of the HTTP request (which can't be altered programmatically – it's read-only).

Cheers
Ken

: Hello

:

: Is there a difference between

: System.Web.HttpContext.Current.User.Identity.Name and

: Request.ServerVariables("AUTH_USER")?

:

:
