I would like to read a page programmatically with an ASP.NET intranet site. I am using forms authentication. No matter what I have tried, the login screen always comes back because the web server itself knows nothing about the authentication information already stored away. I admit that I am a little bit clueless about this whole process, so any info would help. I have read where people say that you need to pass a cookie, using a cookie container, but I'm not sure how exactly that is done and what cookie to pass. I'm using tickets when a comes in under the login screen.

Will post the code later, but for now, just wondering if someone has a clear concise example (or at least an explanation) of what I have to do to get past the forms authentication?
