Is there a way to make my intranet web application NOT automatically use the logged in user when using the "Windows" authentication mode? I want to force the windows popup to always appear, prompting them for a user name and password (with domain name already filled in for them, if possible), as would happen if the logged in user didn't have access to the resource.

I know how to do this with forms authentication, but I'd really rather do it thru windows authentication.

Thanks!
