Am using Site Server membership authentication at the IIS level and then trying to access an ASP.NET application. The issue is i am not able to get the logged in user's identity in the ASP.NET app. The REMOTE_USER or LOGON_USER servervariables in the .NET app always return the Windows NT Impersonation Account ("MemProxyUser") specified in the Membership Server Instance. I have Impersonation = "true" and Authentication = "Windows". With "Forms" i get a blank value. Any help/insight would be greatly appreciated.
