I am using an application which is a modification of IBuySpy Portal. It is using Forms authentication. Users login and their name is added to

Context

Then I use:

`Web.HttpContext.Current.User.Identity.Name`

to write audit trail as to what users do. Now recently on one of the activities I noticed that the

`Web.HttpContext.Current.User.Identity.Name` was blank. Which should not have been possible?

Can someone please tell me why this could have happened? And how I can prevent this?

Thanks,

db
