Hey,

I have searched and searched and searched for direction with this subject. Basically, I would like to use our local Windows 2003 IAS Server to authenticate my web clients. However, I can't, for the life of me, find anyway to do this or any direction of what I need in order to do this.

Basically, (I think) I need to create a radius client? Pass some things to the radius server and then receive a true or false that the person has been authenticated (I know it is probably more complex than that). Besides looking at the RFC's on this, is there any DLL, or any component that I can use to achieve this problem?

Thanks for your help on this!

Bob
