Hi guys,

I am having a problem with the following line of code on Windows XP Pro. The variable `userRole` is a string depicting my role on the local machine.

```
Context.User.IsInRole(userRole)
```

Basically when the ASP.NET page that is calling this code is refreshed the `IsInRole` method returns false when it should be returning true. It's not a consistent error, but it shouldn't be failing all the same.

Any ideas?

Jim...
