I can't do the webservice because the other site won't be able to do that. I can of course do the query string thing, but I don't want the credentials to be messed with.

It seems like the easiest thing would be to use the httpwebrequest as joe pointed out, otherwise I would have to encrypt the data in q string and the other site would have to decrypt it, et. I'm looking to have the other site have to do as little as possible.
