I have seen a number of entries related to accessing remote resources (files in my case) that need to reside on a remote server. We must leave our files on a remote server due to their size. All of the solutions that I have run across have used impersonation with some type of windows or forms based security in the ASP.NET application. Our application does not require user authentication so we use never collect usernames and passwords. The application trying to access the remote resource is a webservice but I do not want to grant the entire web service access to the remote resource.

Is there a way to set full access to a particular remote resource directory that the ASPNET user has access to or a way to specify a username and password at runtime when I access the remote resource?

Thanks,

Tim
