Thanks very much for the reply and for the article but i have made a form authentication already with ADirectory and its working FINE!

But what i want to do now is to authenticate against a particular GROUP for example Security in Active Directory.

For example a USER A logs in and he is not in the group called security he shouldn't have access and if he is in the GROUP Security then he should be authenticated.

I was thinking about using ROLES in Active Directory but my Question is that can i have roles created in Windows 2000 server Active Directory?And if i can can i use form authentication directly to the ROLES in Actice Directory!!.

Thnaks in advance and all ideas are welcome.
