Hi,

I have a dynamic menu in my Intranet application that loads from a database. What I would like to do is to make parent nodes visible based on your group membership in Active Directory. Example

My menu populates with the foll parent nones

Accounting
Sales
Marketing

I have the foll groups in Active Directory

gpAccounting
gpSales
gpMarketing

So if you are a member of gpAccounting and gpMarketing then the respective menus will be loaded. How do I go about doing that? Where can I find info on this.

Thanks
