Hello,

I'm working on a portal based on IBuySpy, where the main page is desktopdefault.aspx and all content is stored in www.domain.com/content/html/nnn or www.domain.com/content/images/nnn and injected in the desktopdefault.aspx page.

How can I prevent users doing www.domain.com/content/images/test.jpg and getting the image (or the html file, or whatever inside the content directory?)

It doesn't matter if the user is authenticated or not, I just want obly the webapplication to be able to load and display the files inside the /content directory.

Can I do this just manipulating the web.config, without changing directory permissions on the webserver?

Thanks!
