Hi Ldraw,

in IIS configuration you can choose who is handling your files.  
Just open the properties of your site and look at application configuration.

There you will find the file assignments.

And you will see, that (for an example) ASPX is assigned to something like  
c:\windows\microsoft.net\framework\v2.0.50215\aspnet\_isapi.dll

Now use one of this .NET assignments choose Edit at ASPX and copy the path of the assigned path.  
Next ADD your file extension (your downloads have – zip for an example) and assigne it to  
the path you copied before.

This in fact means that from now on .NET will handle requests to this file and the security takes place.

We do this normaly for HTM and HTML when we have a site with such files.

HTH

Manfred
