Hello,

I am trying to get the real name of the user from the Active directory via LDAP. However it always returns me the userid, which he uses to login. Furthermore, I would also like to retrieve additional information – i.e what role the user has + phonenr, email etc... Here is the code I used:

```
Dim entry As DirectoryEntry = New DirectoryEntry("LDAP://...",  
"domain\user", "userpw")  
Dim mySearcher As System.DirectoryServices.DirectorySearcher = New  
System.DirectoryServices.DirectorySearcher(entry)  
mySearcher.Filter = "(sAMAccountName=user)"  
  
Response.Write("=====<br>")  
For Each resEnt As System.DirectoryServices.SearchResult In  
mySearcher.FindAll  
Response.Write(resEnt.GetDirectoryEntry.Name.ToString & "<br>")  
Response.Write("=====" & "<br>")  
Next
```
