Hi to all

I face the following problem,

the following code (very simple) is contained in a referenced class method

```
Dim cn As New OdbcConnection("DSN=BOC;UID=Admin;PWD=;")
cn.Open()
```

When aspx page reaches the method containing those lines

I get the following server error:

```
ERROR [IM002] [Microsoft][ODBC Driver Manager]
Data source name not found and no default driver specified
```

Of course I have checked most possible reasons like DSN name and its existence in System DSN and User DSN.

Also checked that this DSN works for example with Access 2000 and it does retrieve data using it from the source it points.

The IIS 6.0 application working process is running as a user that has access and owns this DSN but I always get the same error.

It's strange cause there is no problem with IIS 5 and this came up when the web app was transferred to an Win Server 2003 with IIS 6. Could it be some security tuning that I have overlooked?

Please any ideas on that error will save my day ;-).

Nick
