Hi!

I'm developing a Web Part that will display a users inbox/calendar/contacts in an IFRAME. This could have been simple, BUT some users have folder names that are not standard. Then constructing the URL is not just

<http://server/exchange/>/inbox...>

I've been looking into doing a WebDAC PROPFIND call to Exchange server querying for the urn:schemas:httpmail:inbox attribute. This works as a console application. But, when creating an ASP.NET application, for testing, prior to creating the WebPart, this fails. I've tried setting the `WebRequest.Credentials = CredentialCache.DefaultCredentials`, but that didn't work. I guess I'm bumping into the dual-hop problem?

The task at hand should be fairly simple: get me the URL to a users inbox/calendar/contacts/tasks no matter which language the users folders are in, so that I can supply this as a parameter to the Web Part without having to customize settings for each user.

Anyone?
