Thanks again.

I have used the ldp.exe tool from the webserver box, and I could not make a connection to the domain controller. On my laptop (inside the domain), I could make a connection to that domain controller. Any idea or solution is highly appreciated.

thanks, CalSun

(Lost your reply message, so replying to mine instead :))

In your path, are you specifying the DNS name of a specific domain controller? I would start with that. Additionally, it would be wise to put ldp.exe on your web server machine and make sure you can connect to that DC with it. Ldp.exe can be very useful for troubleshooting LDAP issues.
