Could you have cross-posted on more groups? Zowie!

Anyway, I just saw this error this evening on another app.

If you access your web app from a browser on the server, then the credentials of the accessing user will be used, even if Impersonate is set to true. Accessing from the client will respect the impersonation options for ASP.Net. I'm sure that there is some secret config setting to change this behavior, and perhaps, someday, I'll stumble on it. Until then...

The account you are logging in to when on the server doesn't have the appropriate access. When accessing from the client, it is using a different account, one with the appropriate permissions.

Tell me: do you have anonymous access or Windows Authentication? In the web.config file, do you have <Impersonate> set to True? Are you providing an account in the tag?

(I'll guess your answers: Windows auth, Impersonate = True, and you are providing an account.) If that is the case, then the account you provided in the impersonate tag has the correct permissions, but your login account on the server does not.
