

Using useuri with security: Keep returning to login page

I've tried turning off cookies in FireFox and turning on cookieless sessions in the forms element inside the authentication element (I set the cookieless attribute to UseUri). I'm generating the security token in the URL F(guid).

I can log on successfully and get to the second page in my application (the page after the login page). However, when I attempt to request another page (by, for instance, clicking on one of the links in the Menu control), I find myself right back at the login page with the query string set to the page that I requested. Sure enough if I log on again, I find myself at the requested page.

I suspect that this is related to a problem that I'm having with cookieless sessions. When I set the cookieless attribute in the sessionState attribute to UseUri, the SessionId in the address bar seems to keep changing. As a result, I can't reconnect to the data that I've put in my Session object. In other words, I'll login and, in the address bar, I'll see S(someguid). After clicking a link to go to another page I'll see S(someotherguid).

Any thoughts?
