I hope can explain this properly. I have a time keeping site that host multiple companies data in a single database. I would like the logins to be unique for each company but not across the entire site (i.e. I could have two jsmith logins as long as they are with seperate companies).

I would like to add a drop down box to the login that allow the user to select the company that they are with. By adding a "site" column to the users table I would be able to partition the users so that they would be authenticated only against the id that has a "site" that matches theirs.

Does this require creating a custom membership provider? I have written my own authentication routines in the past and can do so for this projects but I would really like to leverage the existing membership/role capability of ASP2. I'm not sure that I have the skills needed to write a custom membership provider. I just want to make sure that I wasn't missing anything.

Thanks
Dave
