Ehlo :)

I am having this problem:

Server A runs IIS and .NET framework

Server B runs Microsoft Media Server

users authenticate themselves to server A using web forms.

SOME of them, have payed access to server B, so I need to redirect them there and view some streaming content.

On server B there is a user (StreamUser) that can access the streaming content, but not the IUSR.

So, I need to pass user/pass of StreamUser, to server B, and view the content, WITHOUT displaying the authentication window to user. The reason I want to avoid that is, that if he/she knows password for StreamUser, it could pass it away to other people that have not payed for this content.

I am also able to know his real IP, since we are his/hers dialup/adsl provider.

Any ideas?

I tried using impersonation, I did logged on to server A, however, even if I had same user with same pass to server B, it still popups the authenticate window....
