- 

I am making a web application in which user can download files to his machine .

Now I want to copy the required files on temporary internet files folder in user profile with one more folder like RTF where the files can be copied but I am unable to locate the folder on the client machine.

can anyone help me.

I tried System.IO.Directory.GetDirectories but when I run my web site thru another machine it gives the path of the server and not the client machine. which is causing problem.

Please help me.

Thanks in Advance

Purva
