I am not able to run the Asp.Net Configuration tool from inside of a VS 2005 website(I have VSTO 2005)

What happens is the page goes flying by me and returns to the VS 2005 design page I was on.

I was however able to eye ball the URL of the application as it flew by me to get the port number of the localhost.

I then was able to bring up the configuration tool outside of VS 2005 by using the following url

*Note I have left off the http: so it will not show as a link – website is the name of the application

<http://localhost:3932/asp.netwebadminfiles/default.aspx?applicationPhysicalPath=c:\inetpub\wwwroot\website\&appli>

Since it is recognizing the tool on my machine but not from within vs 2005 is it some kind of configuration that I am missing? (I have also reinstalled vs 2005 with no positive results)

I do not have express 2005 I am using sql server 2005 (if this is a consideration).

Any ideas would be helpful.

thanks

.
