A previous post was GREAT in getting me to this point in encrypting my connection string. "Help Encrypting Connection String" in this forum.

What I did not understand is the steps to complete the encryption process.

Is it correct that I should

1) upload the web.config, and then

2) use the code at:

<http://msdn2.microsoft.com/en-us/library/system.configuration.dpapiprotectedconfigurationprovider.aspx>

to create a simple page and then access that page to encrypt the string? And if so can I delete this page after I run it?

Thanks for any help.
