

Re: How to run as in a daemon

user's
don't
have (and shouldn't have) login rights on the server.

Have them set up the scheduled task to run
as the required user.
That's
the
most straightforward way to solve this.

Hi;

We have this web app that
handles security great. For
everything
we do
we
run as the client so we do
not have to store any
credentials
ourselves
and
it
handles Sql Server access,
reading files from the
server,
everything.
But... we have a daemon
program where users can
schedule these

Re: How to run as in a daemon

same
actions.
The problem is, when these
daemon programs run, we
don't have the
client
user
attached and therefore
cannot get their credentials.
Do we need to get their
uname/pw and store it to be
able to runAs
them –
like services in Windows
when running under a user?
I hate to
store
that
info
because that is the keys to
the kingdom.
