Thanks for your reply Dave,

If the users are in the same domain with the webserver and file server, we can programmatically impersonate our application to run under that account and access the file share. However, if they're not in the same domain or trusted domain, impersonate won't work and we will be unable to act as the client user (with username password) and access the remote share. For the limited scenario, you may consider using a trusted account to retrieve the resource (and need to check whether the account has permission in your own code logic)

Sincerely,

Steven Cheng
