Thank you for that info. I am going to try this.

well – what RedirectFromLoginPage internally does is this:

```
FormsAuthentication.SetAuthCookie(...)
Response.Redirect(FormsAuthentication.GetRedirectUrl())
```

split it up in these two operations to see where the problem is more easily....

Dominick Baier (<http://www.leastprivilege.com>)

I have a web application that uses Forms Authentication. The first version of the web application has been working fine. Clients on the internet can hit my site using my IP Address in the URL such as <http://66.62.871.1/MyVirtualFolder/webpage.aspx>. The login page gets displayed as expected. The user puts in UN and PW. My code authenticates and then I call `RedirectFromLoginPage(sUserName, false)`; This was all working fine until the day I updated the site with new aspx files and dll. Now, when a user hits my site using the IP address, the RedirectFromLoginPage does not redirect. The login page remains. If, however, I am in my LAN and use <http://serverName/MyVirtualFolder/webpage.aspx> the page redirects as expected.

There is an exception to this, however. If I use the IP address from my development computer everything works OK. This remains a mystery to me.

I initially thought that it had something to do with my file security.

Re: RedirectFromLoginPage wont redirect

To test that I set my web config file to use impersonation. I used the server's Administrator name and PW as cridentials, however, this did not help. I also, in desperation, gave "Everyone" full access to all the web files. Still the same problem.

I have spent days trying to get to the bottom of this but am out of ideas.

I am still using asp.net 2003 with runtime 1.1

Can someone out there help?
