The AD membership provider fits into the ASP.NET 2.0 membership provider framework which allows for flexibility with the underlying user store mechanism. There are other membership providers as well for stores like SQL.

There is a nice article on using the AD membership provider from the patterns and practices team:

Thanks Joe,
Could you expand on the `ActiveDirectoryMembershipProvider`. I am new to .net 2.0. I have to validate uid-pwd combination and this will not be an intranet site, so I think form authentication is the solution here. The requirements other parts of the web-site are straight but need this AD validation to be strong.
Thanks,
