I used code similar to the one posted by Ivan on 1/4/2003, except that I used byte[] for raw, encrypted and decrypted data. I did not use any streams. Something very strange. I used the CreateEncryptor and CreateDecryptor methods on the Rijndael class and used the TransformBlock methods of the returned ICryptoTransform. Encryption works fine. Decryption works only if you set the Padding property of the Rijndael class to Padding.None. Strange.

Thanks

A Joshi
