Hi All,

Having established that high security rights are required to use raw sockets, I'm unable to pin down exactly what is required in order to create a raw socket.

I've got around the problem by (a) using the administrator account and (b) writing a COM object to do the socket work instead, both of which are undesirable solutions.

What I really want to know is on what security object do I need rights on to do this with any user (that is granted that right)... ?

I was under the false impression that it was to be in the TCB, but having checked my security policy that is not the case.

Can anyone shed any light ?

Thanks,

Richard.
