Scot –

the managed IE control scenario is special in a way the security checks are done. When the security checks walk the stack on the very top of it they see a special AppDomain frame, whose security is based on the html page evidence (url, zone, etc.) rather than your control evidence. To fix the problem what you probably need is find the methods that are called directly from the web page script and Assert() an appropriate permission in those methods.

Hope this helps.
