Thanks Dominic.

At this time, we don't want to use certificates. I want to use public/private key.

All I want is to encrypt the string message using RSA+PKCS#7 and then add a another layer of digital signing to the encrypted messahe using the same and send it out.

I am not able to get this going using the System.Security.Cryptography.Pkcs namespace. I poked around quite a bit in vain.

Can someone help me here? Some code would be really helpful. Thanks in advance.
