Have you tried the workaround described at
<http://www.tjitjing.com/blog/2006/05/failed-to-update-database-xxxmdf.html>?

Hi.

I have serious problems trying to authenticate users with the build in functionality in asp.net 2.0. In the process of trying to debug this problem I've made a very simple webtest application.

Hardware and software info:

- I'm using VS2005 and I'm developing on XP
- I'm using a local DB file for some data (placed in the app_data folder)
- After running asp.net configuration and adding a few users the ASPNETDB.MDF file is generated.
- The form contains a grid view, just viewing a table named Person. This data is viewed without any problems.
- I added a logon control. I can login when I run it at my XP development machine, but after deployment I can't log in anymore. I just get the default message that my login attempt was not successful. I deploy it to a Windows 2003 server standard edition.
- I added a signup wizard. When I try and run this I get the error:

"Failed to update database

"E:\WEBROOT\DBDEPLOYTEST1\APP_DATA\ASPNETDB.MDF" because the database is read-only. " and

"Source Error:

An unhandled exception was generated during the execution of the current web request. Information regarding the origin and location of the exception can be identified using the exception stack trace below.
"

I see no reason for pasting in the stack trace.

Re: Problems accessing the ASPNETDB.MDF file

– To debug even more I added a grid view based on the table: aspnet_Users located in the problem file: ASPNETDB.MDF. This actually shows me that the users I created on my development machine exists, but I can NOT log in with these users.

I've tried adding all rights to aspnet and the iusr_ user on the app_data folder. Did nothing...

I can't figure out where the problem is. I would REALLY appreciate some help.

Thanx,

Fritjolf
