Sounds like a repeat of some earlier problems from last summer. I don't know if any of this will work, but you could try going to Internet Information Services, Home Directory tab, Configuration, App Mappings and see if .asp is still mapped to asp.dll. Also, if I remember correctly (and age IS an issue), it seems like there was some magic in setting application protection (Home Directory tab) to Low. This is all an attempt to remember stuff from a year ago. Hope it helps, or at least does no harm.
