Gabriela,

You wrote:

I have a web site.

The security configuration in IIS is:

- Basic authentication
- I specify the domain name

Is there any way to know from the application (web site) which is the domain that I specify at IIS configuration?

The default domain information is stored in the registry. Are you concerned about security? Since you are using basic, a sniffer will get the domain, username and password as they must be passed over the network.

I'm not really sure I understand the questions
